WELCOME

How to use this guide

A careful guide to glucose, insulin resistance, blood vessels, dementia risk, and everyday habits that may support brain health. It is designed for ordinary days, imperfect schedules, mixed budgets, and real families.

Use it for education

This guide cannot diagnose, treat, or replace medical care. Individual needs vary, and medicines or insulin should not be changed based on a PDF.

Contents

03	Mindful Diabetes mission	12	What increased risk means
04	What glucose does	13	Blood pressure and cholesterol
05	How insulin helps	14	Physical activity
06	Insulin resistance	15	Food patterns
07	The brain needs steady support	16	Sleep
08	Blood vessels and brain health	17	Smoking and alcohol
09	High blood sugar over time	18	Hearing, vision, and connection
10	Low blood sugar	19	Questions for a clinician
11	Diabetes and cognitive risk	20	What prevention can and cannot promise

MINDFUL DIABETES MISSION

Mindful Diabetes mission

Mindful Diabetes connects education, prevention, research awareness, and practical tools at the intersection of metabolic and brain health.

- The goal is clarity, not fear.
- Risk can be influenced, but not perfectly controlled.

WHAT GLUCOSE DOES

What glucose does

Glucose and insulin pathway

Glucose is one of the body's energy sources. The brain uses glucose, but it also depends on steady blood flow, oxygen, sleep, and many other supports.

- More is not always better.
- Very low glucose can be dangerous.

HOW INSULIN HELPS

How insulin helps

Insulin helps move glucose from the blood into cells. Diabetes care often includes supporting glucose levels near a personal target range. [1]

- Targets are individualized.
- Medication decisions belong with your care team.

Try this

Choose one small action from this page and test it for one ordinary day. Keep what helps and adjust what does not.

INSULIN RESISTANCE

Insulin resistance

Blood vessels and brain

Insulin resistance means cells do not respond to insulin as easily. The body may need more insulin to move glucose into cells.

- It can develop gradually.
- Food, movement, sleep, stress, weight, medicines, and genetics can all be involved.

THE BRAIN NEEDS STEADY SUPPORT

The brain needs steady support

The brain is sensitive to glucose changes. CDC notes that both high and low blood sugar can affect the brain and blood vessels. [1]

- Repeated lows and prolonged highs both deserve care.
- Ask what patterns matter for you.

BLOOD VESSELS AND BRAIN HEALTH

Blood vessels and brain health

Brain-health factors wheel

Blood vessels carry oxygen and nutrients to the brain. Diabetes, high blood pressure, and cholesterol concerns can affect vascular health over time.

- Vascular dementia is different from ordinary forgetfulness.
- Sudden confusion can be an emergency.

HIGH BLOOD SUGAR OVER TIME

High blood sugar over time

Frequent hyperglycemia can stress blood vessels and nerves. Effects may build slowly and are not always obvious in the moment. [1]

- This is a reason for support, not shame.
- Patterns are more useful than one isolated reading.

Try this

Choose one small action from this page and test it for one ordinary day. Keep what helps and adjust what does not.

LOW BLOOD SUGAR

Low blood sugar

Health-number tracker

A1C	BP	LDL	sleep	activity	medicine	notes

Hypoglycemia can cause shakiness, dizziness, confusion, trouble speaking, seizures, or loss of consciousness. It can be urgent, especially for people using insulin or certain medicines. [1]

- Know your care team's low-glucose plan.
- Do not drive or ignore severe symptoms.

DIABETES AND COGNITIVE RISK

Diabetes and cognitive risk

Diabetes is associated with increased risk for cognitive problems and dementia, but it does not make dementia inevitable. Dementia has many causes and contributors. [2]

- Risk is not destiny.
- Memory concerns deserve evaluation.

WHAT INCREASED RISK MEANS

What increased risk means

Glucose and insulin pathway

Risk describes probability across groups. It cannot tell you what will happen to one person. Habits, medical care, social factors, genetics, and environment all interact.

- Avoid panic.
- Use risk information to guide questions and care.

BLOOD PRESSURE AND CHOLESTEROL

Blood pressure and cholesterol

Managing blood pressure and cholesterol can support heart and brain health. NIA and CDC identify vascular health as part of cognitive-health protection. [2,3]

- Ask for your numbers.
- Ask what target range fits your age and health history.

Try this

Choose one small action from this page and test it for one ordinary day. Keep what helps and adjust what does not.

PHYSICAL ACTIVITY

Physical activity

Blood vessels and brain

Regular physical activity can support cardiovascular, metabolic, mood, sleep, and brain health. Start with what is safe and possible.

- Walking is one option, not the only option.
- Chair movement and physical therapy can count.

FOOD PATTERNS

Food patterns

Food patterns that include vegetables, fruits, legumes, whole grains, lean or plant proteins, and unsaturated fat sources can support metabolic and cardiovascular health.

- No single brain-protection food is magic.
- Budget and culture matter.

SLEEP

Sleep

Sleep problems can affect mood, energy, glucose patterns, and daily decision-making. A realistic sleep plan may require medical care.

- Ask about sleep apnea symptoms.
- Caregiving, shift work, pain, and medications matter.

Try this

Choose one small action from this page and test it for one ordinary day. Keep what helps and adjust what does not.

SMOKING AND ALCOHOL

Smoking and alcohol

Questions for your clinician

targets	meds	A1C	BP	cholesterol	memory	sleep

☐	☐	☐	☐	☐	☐	☐
☐	☐	☐	☐	☐	☐	☐
☐	☐	☐	☐	☐	☐	☐
☐	☐	☐	☐	☐	☐	☐

Smoking and excessive alcohol use are dementia risk factors identified by public-health sources and dementia-prevention research. [2,4]

- If you do not drink alcohol, do not start for health.
- Ask for support if quitting tobacco feels hard.

HEARING, VISION, AND CONNECTION

Hearing, vision, and connection

Hearing loss, vision problems, depression, and social isolation can affect cognitive health and quality of life. [2,3,4]

- Treating hearing or vision problems may reduce strain.
- Social contact can be practical, not fancy.

Try this

Choose one small action from this page and test it for one ordinary day. Keep what helps and adjust what does not.

QUESTIONS FOR A CLINICIAN

Questions for a clinician

Everyday brain health

Bring questions about A1C, blood pressure, cholesterol, medicines, low-glucose risk, memory changes, sleep, hearing, and family history.

- Write questions before the visit.
- Bring a medication list.

WHAT PREVENTION CAN AND CANNOT PROMISE

What prevention can and cannot promise

Healthy routines may help reduce risk and support daily function. They do not guarantee prevention of Alzheimer's disease, reverse every case of diabetes, or replace medical care.

- Use careful hope.
- Stay connected to qualified care.

REFERENCES AND SAFETY

References, resources, and medical disclaimer

This guide is for general education only. It is not medical advice, diagnosis, or treatment. Talk with a licensed healthcare professional before making significant changes, especially if you are pregnant, have kidney disease, a history of eating disorder, food allergies, gastrointestinal disease, severe low blood sugar, severe high blood sugar, or other medical conditions.

Do not change medication, insulin, or glucose targets based on this guide. Seek appropriate medical attention for urgent symptoms, including severe hypoglycemia, severe hyperglycemia, sudden confusion, chest pain, trouble breathing, fainting, or seizures.
